

Fig 1: Revelation deficit vs gamma — K=4 vs K=3 (smooth-kernel halo operator, $h=0.45*\text{sqrt}(du)$)

$\tau = 0.1$

$\tau = 0.2$

$\tau = 0.4$

$\tau = 0.6$

Fig 2: Deficit vs number of traders at fixed (tau, gamma)

G=11, tau=0.2: deficit vs K

G=15, tau=0.2: deficit vs K

Fig 3: Trading volume per agent vs gamma (G=15)

Fig 4: Value-of-information decomposition per K

Private value of information, $\tau=0.2$

Public (price) value of information, $\tau=0.2$

Fig 5: Certification residual per cell (red x = not converged)

Fig 6: What drives the deficit — K-ratio and gamma-scaling

K=4/K=3 deficit ratio (G=15)

1/gamma asymptote check: gamma*deficit

Fig 7: K=4 and K=5 deficit relative to K=3 at identical discretisation (G=11)

tau = 0.1 (G=11)

tau = 0.2 (G=11)

tau = 0.4 (G=11)

tau = 0.6 (G=11)

Fig 8: Price aggregation — equilibrium slope $\times K / \tau$, $\tau=0.2$
(full revelation would be $\text{slope} \times K / \tau = K$)
