

F1 -- Certified deficit vs γ (log-log)
no noise traders; deficit > 0 and $\rightarrow 0$ as $\gamma \rightarrow \infty$

the asymptotic-to-zero behaviour at large γ

F1c -- Zoom on $\gamma \leq 3$ (both axes linear)

F2 -- $\tau = 0.05$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail $1/\gamma$ fit

linear y axis: emphasizes large- γ vanishing

F3 -- $\tau = 0.1$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail $1/\gamma$ fit

linear y axis: emphasizes large- γ vanishing

F4 -- $\tau = 0.2$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail 1/ γ fit

linear y axis: emphasizes large- γ vanishing

F4a -- $\tau = 0.3$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail $1/\gamma$ fit

linear y axis: emphasizes large- γ vanishing

F4b -- $\tau = 0.4$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail $1/\gamma$ fit

linear y axis: emphasizes large- γ vanishing

F4c -- $\tau = 0.5$, 20 certified cells, $\gamma \in [0.05, 30.0]$

log--log, tail $1/\gamma$ fit

linear y axis: emphasizes large- γ vanishing

F5 -- Log-odds slope; dotted = revealing benchmark τ

F6 -- Certification: all cells under the 10^{-15} bar

F7 -- Deficit map (140 certified cells)

F8 -- Certified equilibrium P slice $u_3 = 0$ at $(\tau, \gamma) = (0.1, 0.05)$
deficit = 1.331e-01

F9 -- Certified equilibrium P slice $u_3 = 0$ at $(\tau, \gamma) = (0.1, 1.035)$
deficit = $1.734\text{e-}05$

F10 -- Certified equilibrium P slice $u_3 = 0$ at $(\tau, \gamma) = (0.1, 30.0)$
deficit = 3.165e-08

F11 -- $\text{logit } P$ vs $\sum u$ at $(\tau, \gamma) = (0.1, 0.05)$
deficit = $1.331\text{e-}01$ = the unexplained scatter

F12 -- Asymptotic $1/\gamma^p$ scaling of the deficit
(Jensen-wedge theory predicts $p = 1$)

F13 -- Per- τ panels, linear y axis

$\tau = 0.05$ (max d = 0.0591)

$\tau = 0.10$ (max d = 0.133)

$\tau = 0.20$ (max d = 0.17)

$\tau = 0.30$ (max d = 0.176)

$\tau = 0.40$ (max d = 0.182)

$\tau = 0.50$ (max d = 0.186)

F14 -- Trading volume vs γ 

F15 -- Value of observing the equilibrium price (vs. prior)
monotone, dominant share of total Vol

F16 -- Value of the PRIVATE signal above the price
small but POSITIVE in PR equilibrium

F17 -- Welfare gap to full revelation
how much the PR-REE leaves on the table

F18 -- Deficit vs welfare gap (cell-level scatter)
both measure how much the PR-REE differs from FR

F19a -- Value-of-information decomposition at $\tau=0.05$

F19b -- Value-of-information decomposition at $\tau=0.2$

F19c -- Value-of-information decomposition at $\tau=0.4$
